

TCGA.SampleSelection Documentation

Description: Retrieve TCGA data from Broad Firehose and perform sample selection on the basis of expression levels for specific genes of interest for analysis using GSEA tools.

Author: Anthony S. Castanza

Contact: genepattern.org/help

Summary: Queries cBioPortal for TCGA samples meeting criteria of mRNA expression z-scores relative to all samples (log RNA Seq V2 RSEM) greater than and less than user supplied thresholds. Outputs a GCT file containing TPM (Transcripts per Million) normalized RNA-seq quantifications suitable for ssGSEA, and a CLS file annotating samples as High or Low expression of the gene of interest.

Parameters:

Name	Description
TCGA Collection*	TCGA study cohort (tumor types) to query for sample selection.
Gene Symbol*	The HGNC Gene Symbol to use for classifying samples as high or low expression
High Expression*	mRNA expression is greater than or equal to this threshold for standard deviations above the mean will be classified as "high" expression of the selected gene. (mRNA expression z-scores relative to all samples)
Low Expression*	mRNA expression is less than or equal to this threshold for standard deviations below the mean will be classified as "low" expression of the selected gene. (mRNA expression z-scores relative to all samples)
Output Type*	Type of RSEM quantifications to output: TPM (transcripts per million, within sample normalization, useful for ssGSEA) Raw counts (unnormalized counts, usable with DESeq2 or other DEG calculations).
MSigDB Version*	MSigDB version to use for Gene Symbol lookup. This version should match the version of the gene sets intended for all downstream analysis.

* = required

Output File(s): GCT file containing gene expression values in the selected output type for samples that pass the specified thresholds. A CLS file indicating the sample group assignments (high or low expression).

Module Language: R
